

ABSTRACT

One embodiment of the present invention relates to an eyeglass assembly including a pair of first eyeglasses having a first bridge interconnecting a pair of first lenses and a pair of second eyeglasses having a second bridge interconnecting a pair of second lenses. At least one 5 rib may be formed on a rear portion of the second bridge. A retainer may be integrally formed with the first bridge and may include an upper clamping plate and a lower clamping plate. The lower clamping plate may have at least one restricting groove to correspond to the at least one rib so that combination of the at least rib and the at least one restricting groove is able to combine the first eyeglasses and the second eyeglasses.
